CHARGING THE UNIT IN COOLING MODE

NOTE: Quick connect heat pumps are shipped fully charged with R410A refrigerant and ready for installation and in normal circumstances no refrigerant charging is required. The instructions below are intended for brazed systems or for systems that need to be charged during service calls.

If the outdoor temperature is 65 degrees F or higher:

After completing the refrigerant line connections, leak checking the system, and evacuating the indoor section and all line connections (using proper methods), perform the following steps:

1. Determine the recommended charge addition (if applicable) for the system being installed. This information is in the unit's QRD (Quick Reference Data sheet).
2. Calculate the amount of additional refrigerant needed for the line set length of the actual installation. This information is on the first page of the unit's QRD (Quick Reference Data sheet).
3. Weigh in the additional charge amounts determined by steps 1 and 2 above.
4. Adjust the charge to match the superheat (for fixed orifice systems) or subcooling (for TXV systems). There are three different resources for doing this:
 - a.) The chargecalculator.com website. This will walk you through the charging process step by step.
 - b.) The charging tables on the inside of the outdoor unit's electrical box cover panel. These tables provide superheat targets for fixed orifice systems and subcooling targets for TXV systems. The system should be charged so that the measured superheat/subcooling are within 1 degree F of the target listed in the table.

For fixed orifice systems:

- If your measured superheat at the suction valve is **LESS THAN** the recommended superheat value in the table then **REMOVE** refrigerant.
- If your measured superheat at the suction valve is **GREATER THAN** the recommended superheat value in the table then **ADD** refrigerant.

For TXV systems:

- If your measured subcooling at the liquid valve is **LESS THAN** the recommended subcooling value in the table then **ADD** refrigerant.
 - If your measured subcooling at the liquid valve is **GREATER THAN** the recommended subcooling value in the table then **REMOVE** refrigerant.
- c.) The charging tables in the Supplemental Charging Information, can be found online in the literature library. The tables can also be accessed by scanning the QR code on the unit's electrical panel. The pressures listed in these tables are for reference only and are to be used in troubleshooting a system. **The system should be charged to match the superheat or subcooling targets as previously noted and not to match the system pressures.** Follow the same procedure described in 4b above.

If the outdoor temperature is between 35 degrees F and 65 degrees F:

After completing the refrigerant line connections, leak checking the system, and evacuating the indoor section and all line connections (using proper methods), perform the following steps:

1. Determine the recommended charge addition (if applicable) for the system being installed. This information is in the unit's QRD (Quick Reference Data sheet).
2. Calculate the amount of additional refrigerant needed for the line set length of the actual installation. This information is on the first page of the unit's QRD (Quick Reference Data sheet).
3. Weigh in the additional charge amounts determined by steps 1 and 2 above.
4. Block off the discharge of the outdoor fan. **NOTE:** One half of the unit should be covered corner to corner as shown in Figure 1.
5. **With the unit in cooling mode,** Adjust the charge to match the superheat (for fixed orifice systems) or subcooling (for TXV systems). There are two different resources for doing this:
 - a.) The chargecalculator.com website. This will walk you through the charging process step by step.
 - b.) The low ambient charging tables on the inside of the outdoor unit's electrical box cover panel. These tables provide superheat targets for fixed orifice systems and subcooling targets for TXV systems. The system should be charged so that the measured superheat/subcooling are within 1 degree F of the target listed in the table.

For fixed orifice systems:

- If your measured superheat at the suction valve is **LESS THAN** the recommended superheat value in the table then **REMOVE** refrigerant.
- If your measured superheat at the suction valve is **GREATER THAN** the recommended superheat value in the table then **ADD** refrigerant.

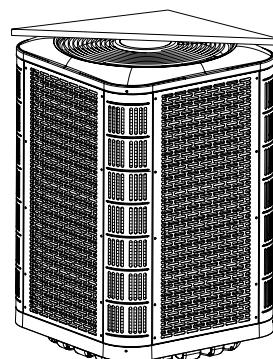

For TXV systems:

- If your measured subcooling at the liquid valve is **LESS THAN** the recommended subcooling value in the table then **ADD** refrigerant.
- If your measured subcooling at the liquid valve is **GREATER THAN** the recommended subcooling value in the table then **REMOVE** refrigerant.

If the outdoor temperature is below 35 degrees F:

After completing the refrigerant line connections, leak checking the system, and evacuating the indoor section and all line connections (using proper methods), perform the following steps:

1. Determine the recommended charge addition (if applicable) for the system being installed. This information is in the unit's QRD (Quick Reference Data sheet).
2. Calculate the amount of additional refrigerant needed for the line set length of the actual installation. This information is on the first page of the unit's QRD (Quick Reference Data sheet).
3. Weigh in the additional charge amounts determined by steps 1 and 2 above.

NOTE: One half of the unit should be covered corner to corner.

SC = Subcooling at the liquid valve; SH = Superheat at the vapor valve

-Subcooling tolerance is ± 1°F

-Superheat tolerance is ± 1°F

-The subcooling and refrigerant pressures on this table are reference values for troubleshooting purposes only. Charge to superheat.

-All temperature measurements are in degrees Fahrenheit.

-All pressure measurements are in PSIG.

-Boxed data point is the performance rated condition

-Having Difficulties? Try www.chargecalculator.com

SC = Subcooling at the liquid valve; SH = Superheat at the vapor valve

-Subcooling tolerance is ± 1°F

-Superheat tolerance is ± 1°F

-The subcooling and refrigerant pressures on this table are reference values for troubleshooting purposes only. Charge to superheat.

-All temperature measurements are in degrees Fahrenheit.

-All pressure measurements are in PSIG.

-Boxed data point is the performance rated condition

-Having Difficulties? Try www.chargecalculator.com

SC = Subcooling at the liquid valve; SH = Superheat at the vapor valve

-Subcooling tolerance is ± 1°F

-Superheat tolerance is ± 1°F

-All temperature measurements are in degrees Fahrenheit.

-All pressure measurements are in PSIG.

-The subcooling and refrigerant pressures on this table are reference values for troubleshooting purposes only. Charge to superheat.

-Boxed data point is the performance rated condition

-Having Difficulties? Try www.chargecalculator.com

SC = Subcooling at the liquid valve; SH = Superheat at the vapor valve

-Subcooling tolerance is ± 1°F

-Superheat tolerance is ± 1°F

-The subcooling and refrigerant pressures on this table are reference values for troubleshooting purposes only. Charge to superheat.

-All temperature measurements are in degrees Fahrenheit.

-All pressure measurements are in PSIG.

-Boxed data point is the performance rated condition

-Having Difficulties? Try www.chargecalculator.com

SC = Subcooling at the liquid valve

-Subcooling tolerance is ± 1°F

-Refrigerant pressures are reference values for troubleshooting purposes only

-All temperature measurements are in degrees Fahrenheit.

-All pressure measurements are in PSIG.

-Boxed data point is the performance rated condition

-Having Difficulties? Try www.chargecalculator.com
